Value Chain Analysis Training
ACIAR Project ASEM/2014/053
Value Chain Definition

Value chain refers to the full range of activities that are required to bring a product (or a service) from conception through the different phases of production to delivery to final consumers and disposal after use (Kaplinsky 1999; Kaplinsky and Morris 2001).

A value chain looks at the complex range of activities implemented by various actors (primary producers, processors, traders, service providers) to bring a raw material through a chain to the sale of the final product. The ‘broad’ value chain starts from the production system of the raw materials and will move along the linkages with other enterprises engaged in trading, assembling, processing, etc.
Value Chains can be relatively simple

Input providers
- Fries, fingerling
- Feed
- Chemicals & medicines

Grow out farmer

13.8% → Traders
86.2% → Processors

4.6% → Wholesalers
9.2% → Retailers
8.6% → Exporting

77.6% → Domestic consumers
Value Chains can be very complex
Systematic Mapping

Value-chain analysis *systematically maps the actors* participating in the production, distribution, marketing, and sales of a particular product (or products). This mapping assesses the characteristics of actors, profit and cost structures, flows of goods throughout the chain, employment characteristics, and the destination and volumes of domestic and foreign sales.
Distribution of Benefits

Value-chain analysis can play a key role in identifying the distribution of benefits of actors in the chain. That is, through the analysis of margins and profits within the chain, it is possible to determine who benefits from participation in the chain and which actors could benefit from increased support or organisation.
Upgrading

Value-chain analysis can be used to examine the role of upgrading within the chain. Upgrading can involve improvements in quality and product design or diversification in the product lines served, allowing producers to gain higher value. An analysis of the upgrading process includes an assessment of the profitability of actors within the value chain as well as information on limitations that are currently present.
Governance

Value-chain analysis highlights the role of governance in the value-chain, which can be internal or external. Governance within a value-chain refers to the structure of relationships and coordination mechanisms that exist between actors in the value-chain. Governance is a broad concept which basically ensures that interactions between chain participants are organised, rather than being simply random.
Holistic Approach

DIRECT ACTORS
Who are they?
What roles do they play?

Economic forces
Legal/political forces

END CONSUMER

INDIRECT ACTORS
Who are they?
How do they support (or not support) direct actors?

Suppliers
Operational services
Support services
Regulatory bodies

Transport
Packing
Processing
Training

Environmental forces
Technological forces
Socio-cultural forces

EXTERNAL INFLUENCES
Within what context does the value chain operate?

Australian Government
Australian Centre for International Agricultural Research

CIAT
International Center for Tropical Agriculture
Since 1967 Science to cultivate change

The University of Queensland
Australia
Create change
