

Bracing for the future

**Day 2: How modelling and data
contribute to foresight and scenario
analysis**

Aims for the day

Introduce

- Role of models and data in foresight analysis
- What different models can do
- Key models used for food systems
- Data needs for models and key datasets for EGP
- How models can inform policy, dialogue and debate

Modelling 101

Robyn Johnston ACIAR

Don Gaydon CSIRO

Models - definition

A simplified representation of real world systems to

- Help understand processes and interactions
- Extrapolate beyond known time / location / conditions
- Build a shared understanding of the system

Types of models

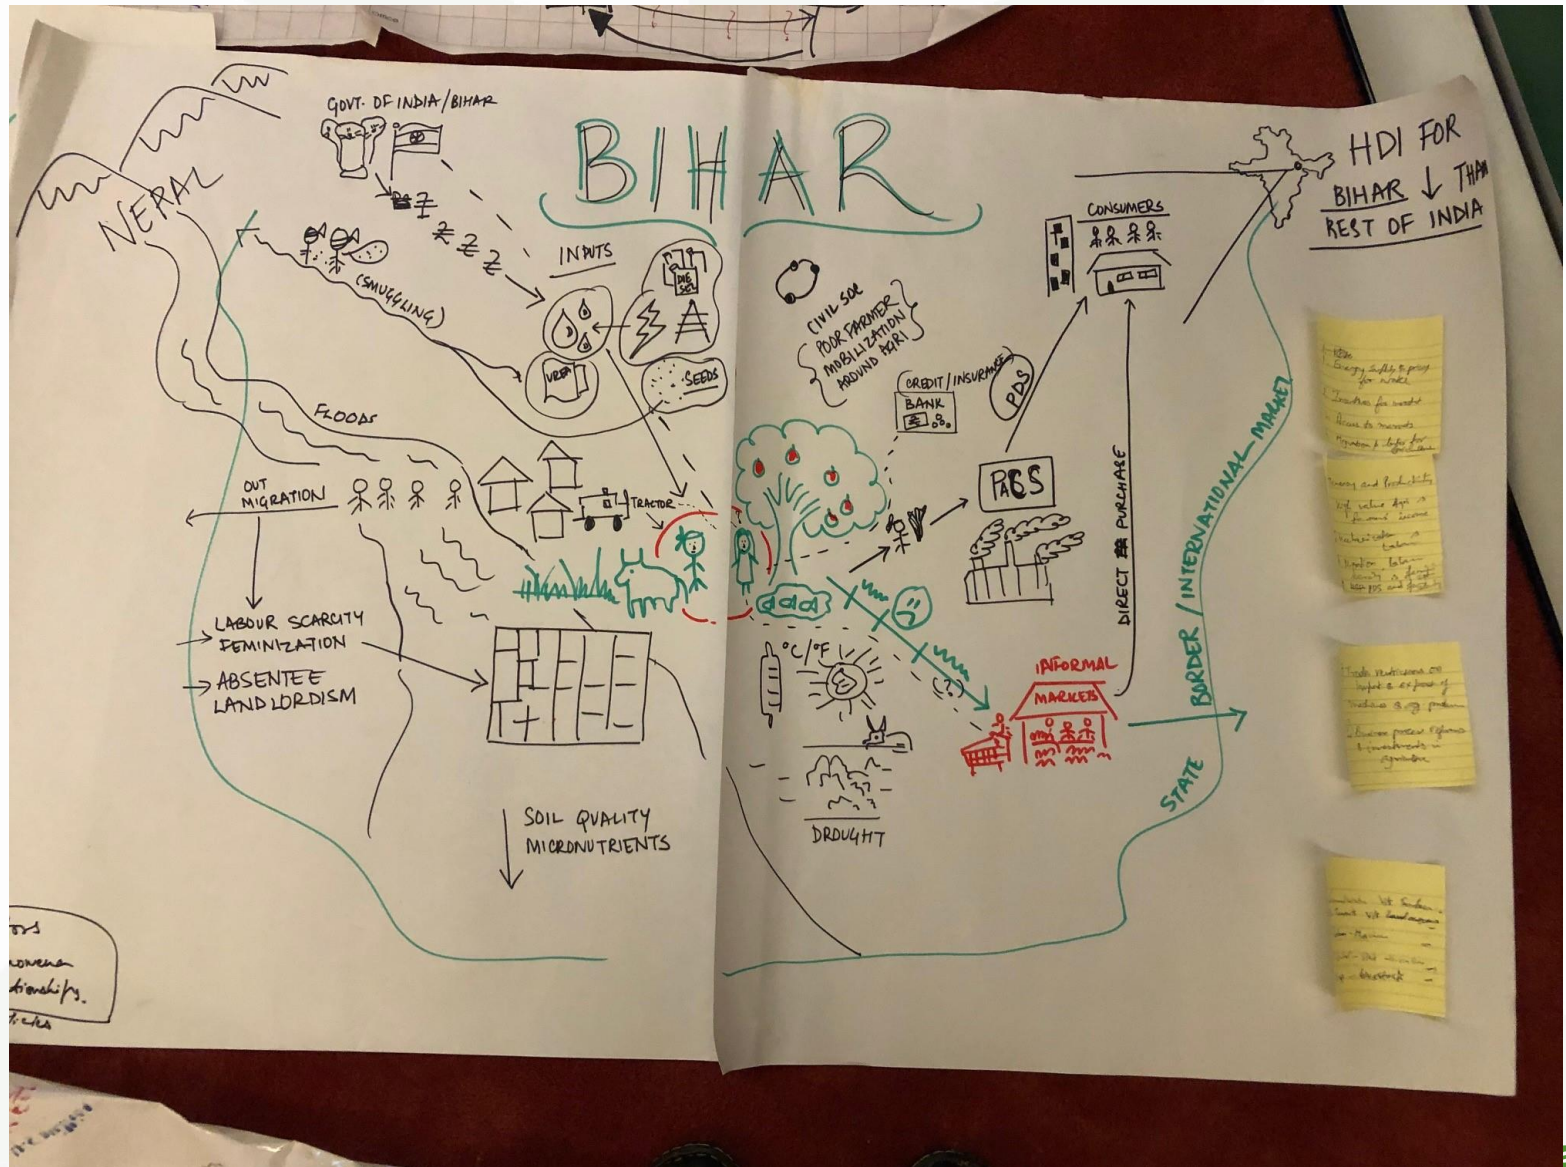

- Physical (3D)
- Conceptual
- Visualisation
- Quantitative (mathematical / statistical)

Physical models

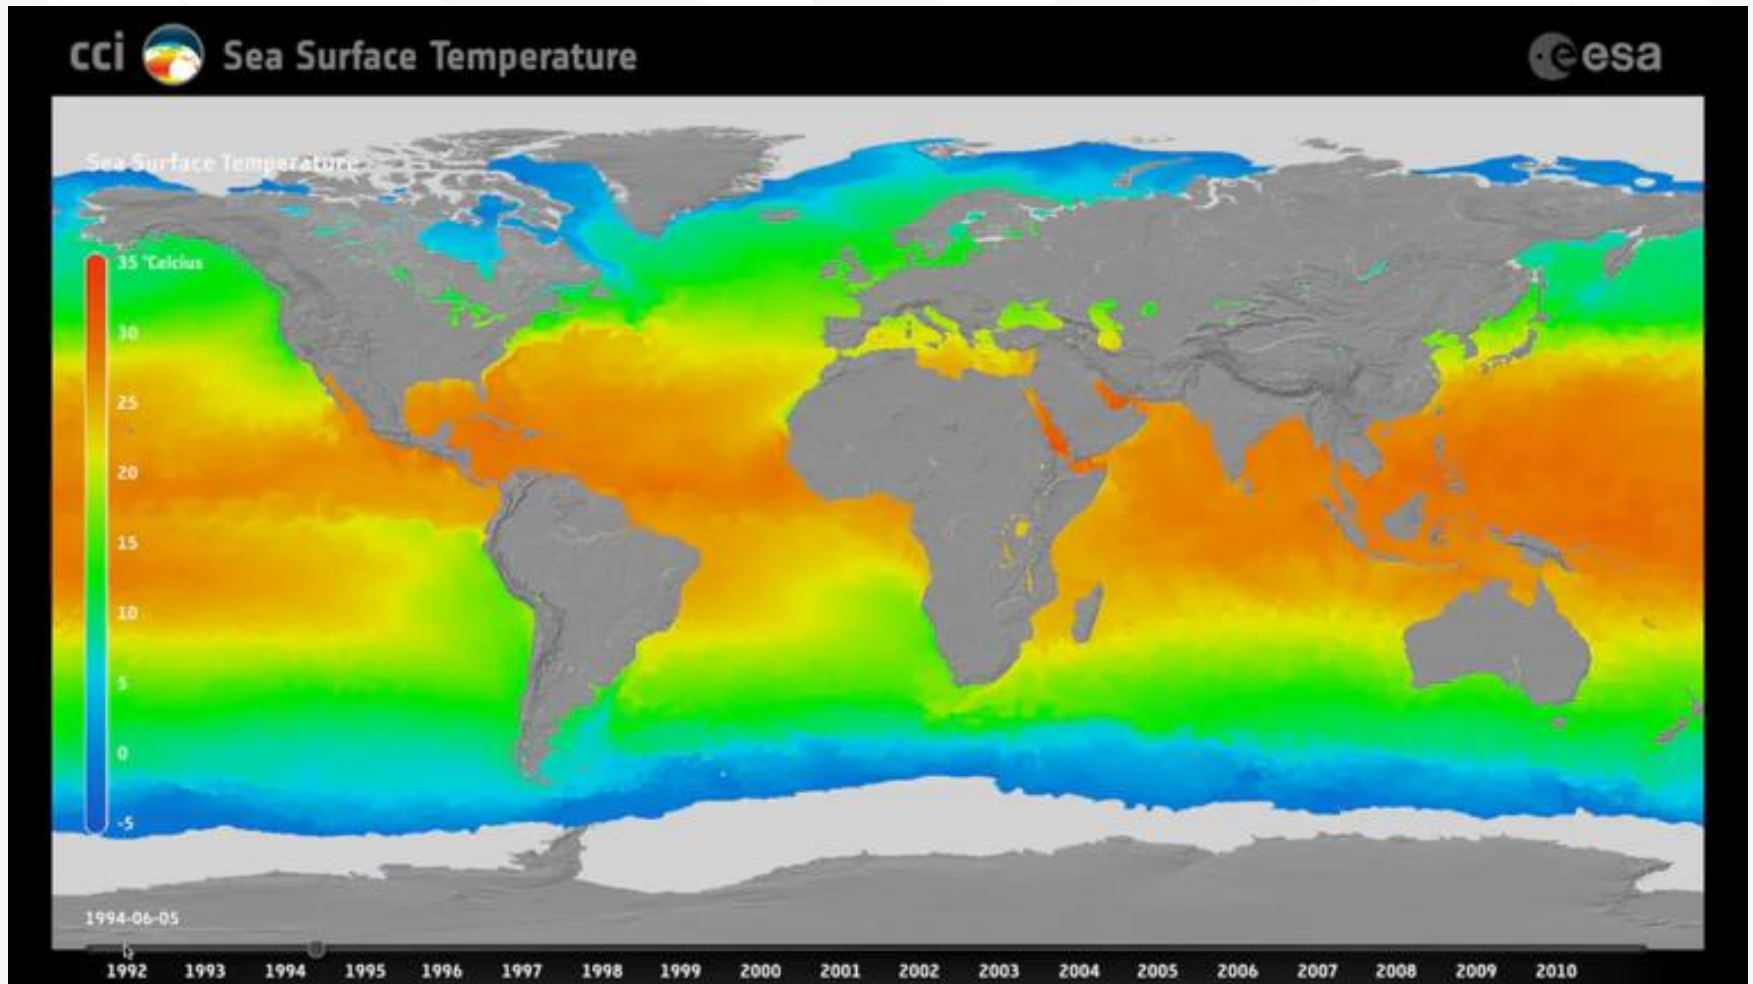

Ayeyarwady State of Basin Assessment – 3D basin model

Conceptual models

Visualisation of observed or modelled data

Visualisation of observed or modelled data

<https://www.youtube.com/watch?v=PhbdyNnUliM>

Quantitative models

- Mathematical and/or statistical ways to
 - Explore and quantify interactions within systems
 - Extrapolate from observations or experiments to larger spatial or temporal domains, or to different systems
- Operate at a range of scales (in space and time)
- Deal with complexity
 - Loops and feedbacks, multiple runs / scenarios
- Coupled models
 - can link biophysical and economic / social processes
 - linking models vs linking results from models

Uncertainty

Uncertainty – many sources including data quality, parameters, algorithms, assumptions, model bias, unmodelled effects and more

Model calibration - estimating model parameters from observed data for one part of the system (*making the model fit the system*).

Model validation - judging the performance of the **calibrated model** using observed data which have not been used for the calibration (*checking that the model describes the system*)

Uncertainty - accuracy, precision

Uncertainty – assumptions

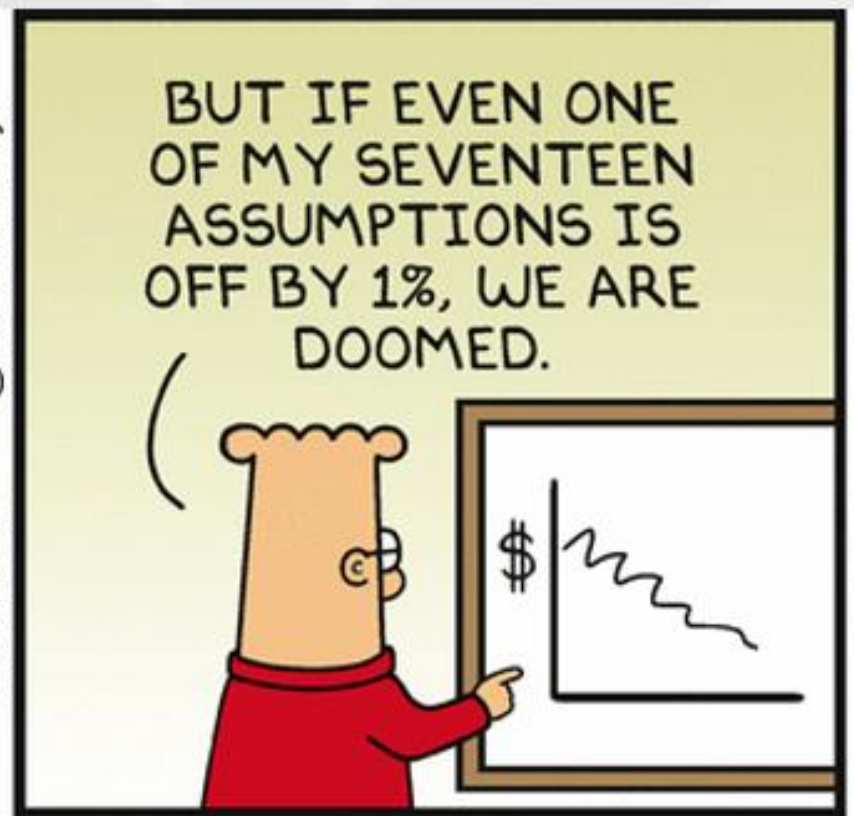

Uncertainty – assumptions

Dilbert.com

The new buzz words

Fuzzy logic is an approach to computing based on "degrees of truth" rather than the usual "true or false"

Bayesian models - a statistical model where you use probability to represent relationships and uncertainty

Artificial neural networks are computing systems inspired by the biological neural networks of animal brains

Ways of dealing with complexity and uncertainty

Models

The most that can be expected from any model is that it can supply a useful approximation to reality:

All models are wrong; some models are useful

George Box

Always ask:

- What is the overall uncertainty?
- What are the underlying assumptions, and how sensitive are the results to those assumptions?

Some examples of systems that we model....

Soil-biosphere-atmosphere systems

Farm-scale models

Some examples of systems that we model.....

Soil-biosphere-atmosphere systems

Units: Thousand cubic km for storage, and *thousand cubic km/yr* for exchanges *1990s

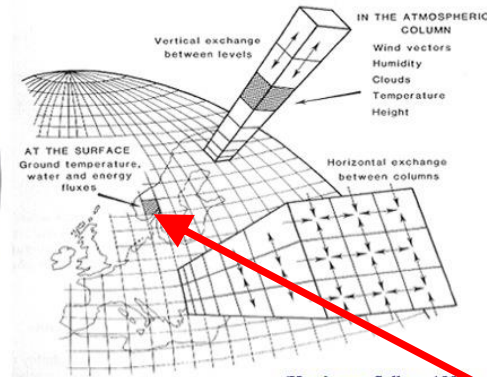

Hydrological models

Some examples of systems that we model....

Soil-biosphere-atmosphere systems

Grid Point Models

(Henderson-Sellers, 1985)

Global Climate Models

Some examples of systems that we model....

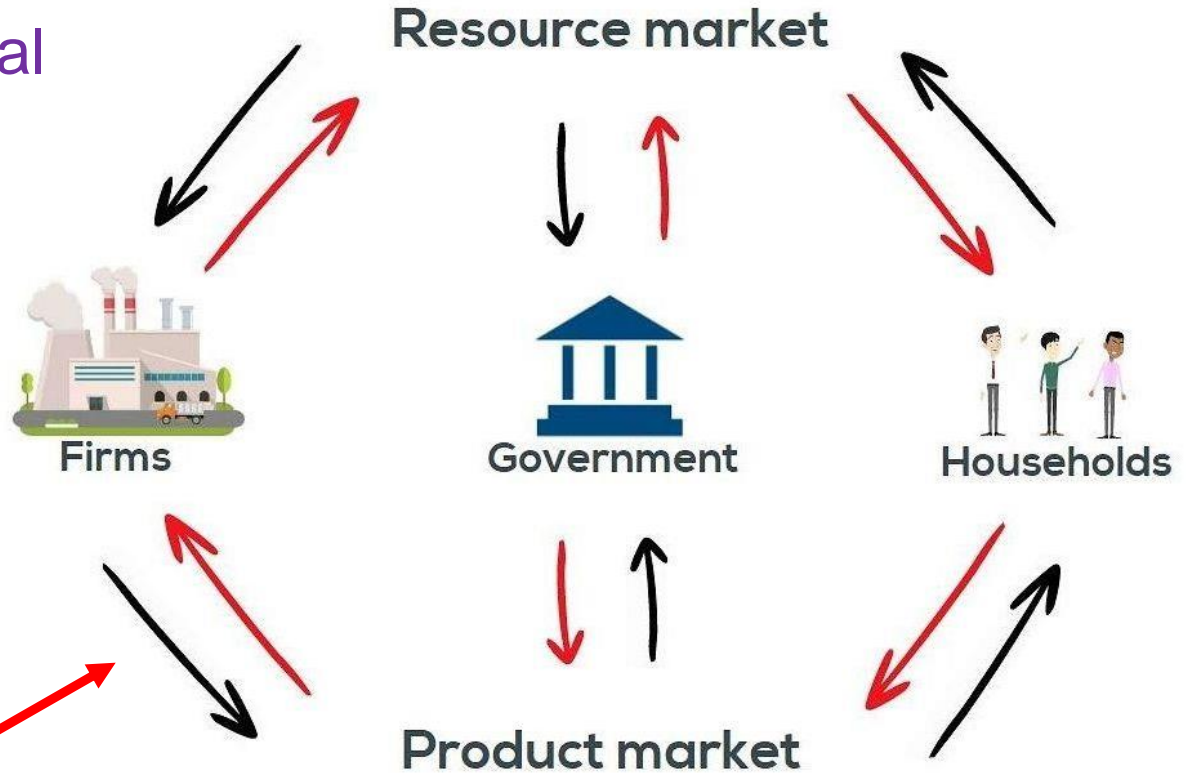

But Food Systems
involve more than 'agriculture' ...

Food Systems models

Some examples of systems that we model....

Regional or National
Socio-Economic
models

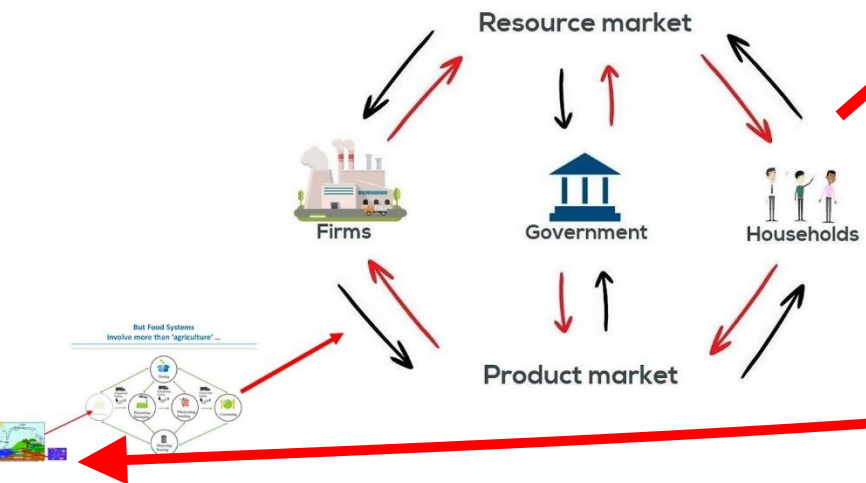

But Food Systems
involve more than 'agriculture' ...

Some examples of systems that we model....

Global Economic models

comes back to farmer..... fuel prices, grain prices etc
